

LYNX-HEALTHCARE FRAMEWORK SOFTWARE APPLICATION

Overview

Lynx Healthcare Framework (Lynx-HCF) is a cloud based healthcare software application which is used to manage workflow, comprehensive patient electronic medical record (EMR), patient data management, reporting and consultations (physical or remote) providing the ultimate solution for patients and healthcare service providers.

The patient's clinical information is captured and persisted in a database hosted in the cloud and is accessible from any location on a range of devices (web, mobile and tablets) by users (doctors, nurses, patients & healthcare service providers) in different roles with varying access and control levels. All patient data is available in realtime independent of where a patient is consulted or situated.

Lynx-HCF can be used in most clinical settings where doctors and other healthcare professionals interact with patients, making the software especially useful in primary healthcare environment, occupational health clinics and prevalence studies/screening.

GASTROINTESTINAL DISEASE	NO	YES
KIDNEY DISEASE	NO	YES
BLOOD DISORDER	NO	YES
PSYCHIATRIC ILLNESS	NO	YES
HIV	NO	YES

The Lynx-HCF software has a modern and comprehensive data capturing interface that ensures easy capturing of the following relevant data as well as historic medical and clinical information encapsulated in the EMR:

- Patients Details, Biometrics etc.
- History
- Vitals
- Examination Results / Findings
- Diagnoses
- Treatments (Medication, Procedures & Immunisations)
- Referrals
- Sick Letters
- Prescriptions
- Patient Management and Intelligent Notification Services

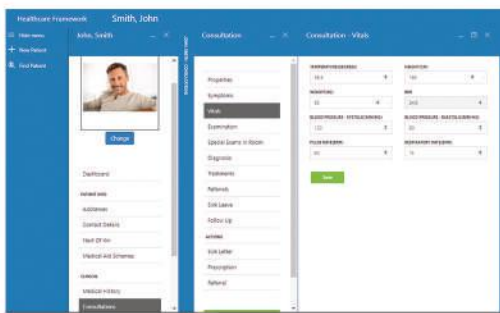

With each visit to the clinic / service provider a new consultation is completed for a specific patient. Patients will have multiple consultations linked to, or contained in their EMR and consultations can be threaded together to provide an overview and statistics over time.

Each patient's clinical data can be displayed graphically in the particular patient's Dashboard in the application. Trends can be monitored and patients managed accordingly giving an easy overview of the patient health status and monitoring.

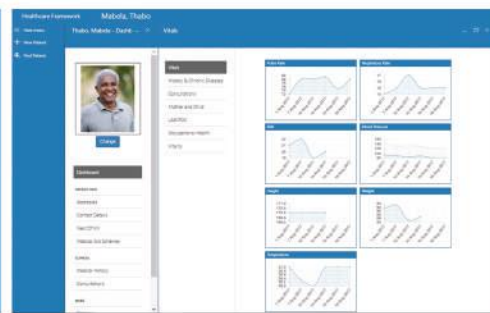

Medical records can be shared with any third party given authorization and have data stored in one safe place – in the cloud. Mobile and wearable devices can connect and feed real-time data into the EMR giving patients the opportunity to pro-actively contribute to their own healthcare profile.

Healthcare practitioners subscribed to the Lynx-HCF solution can initiate a tele-medicine video call with patients waiting in the virtual consulting room from the in-app worklist, thereby removing the logistical burden of physical consultations. The rate at which patients can be consulted increases and the time spent per patient is reduced along with administrative functions normally performed by the practitioner's personnel. Prescriptions and referrals are generated by the software and can be printed or distributed via e-mail.

Reports

Lynx-HCF offers comprehensive reporting and statistical analysis and can be customized to suit our clients needs

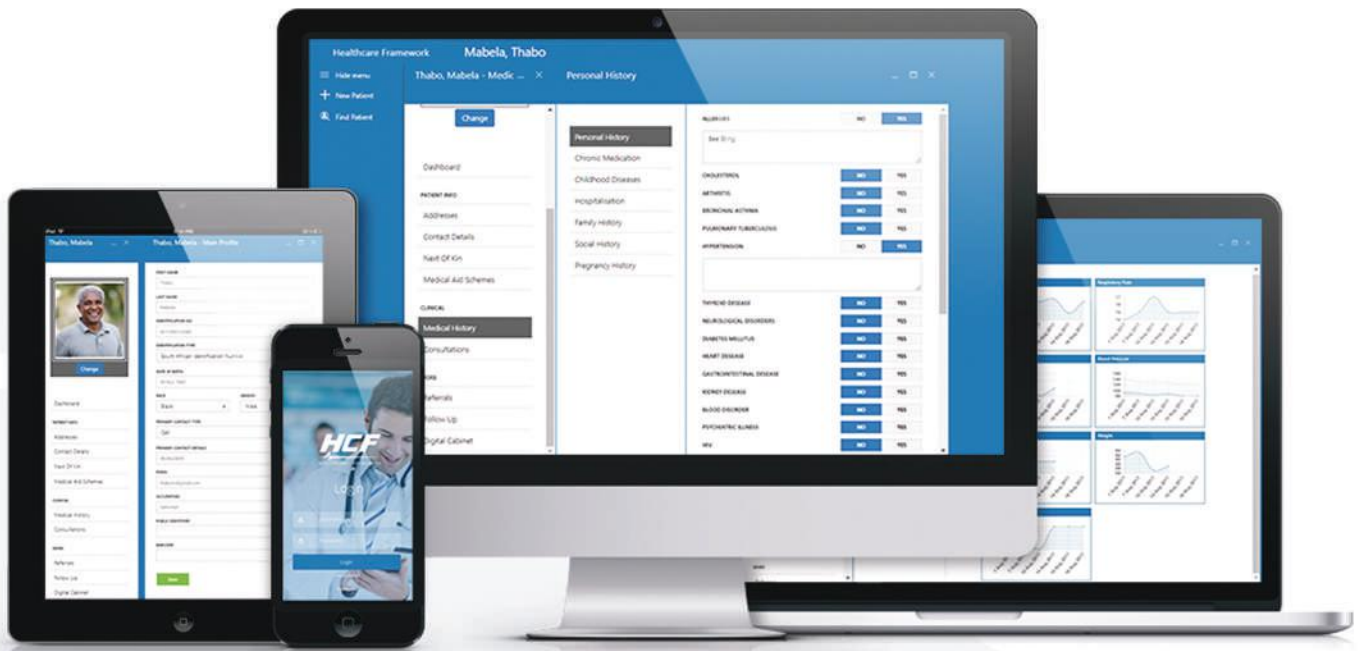

Lynx-Healthcare Framework Software provides a holistic approach to patient data management. Documents, images and patient data can be uploaded and linked to patients to conveniently have the patient record available online 24/7.

The software provides access to ICD-10 codes and medicines which is maintained and updated by Lynx-HCF on a regular basis.

Healthcare practitioners can view administrative and statistical reports which can be filtered and transmitted electronically via email. Reaching out to patients and notifications is an integral part of the doctor-patient communication process and can be configured for various scenarios.

Remote healthcare via tele-medicine has been taken to the next level and Lynx-HCF's application framework will evolve over time to include an ever increasing functionality spectrum in an interconnected web of providers, consumers, devices and data.
